

WEEK 5: Write a program that calculate hours in a day. Your program should use an interface with two methods and your class should implement the interface

```
interface TimeCalculator {
    int calculateHours();
    void displayResult();
}

class Day implements TimeCalculator {

    private int days;

    Day(int days) {
        this.days = days;
    }

    @Override
    public int calculateHours() {
        return days * 24;
    }

    @Override
    public void displayResult() {
        System.out.println("There are " + calculateHours() + " hours in " + days +
" day(s).");
    }
}

public class HoursInADay {
    public static void main(String[] args) {

        Day day = new Day(1);

        day.displayResult();
    }
}
```
